

Case 2 Left breast lesion 83yr old female

- A Section of breast shows an infiltrative tumour consisting of many patterns including cribriform, nested, solid and cord like features.
- Lined by two cell types, one being the ductal luminal epithelial with bland angulated cells overlying the small pale to clear myoepithelial cells.
- The tumour is set within a desmoplastic stroma.
- There is no vascular or perineural invasion seen.

Diagnosis: Adenoid cystic carcinoma

Comment: *IHC* ER –ve, PR –ve HER2 –ve
Treat with clear margins
Good prognosis/ recur or metastasis less than ductal NST
0.1% of breast carcinomas
