

CASE 13

Microscopy

Well-circumscribed lesion composed of mature adipocytes with a central area showing histiocyte haemopoiesis consistent with extramedullary haemopoiesis. There is an increase in megakaryocytes present. There is no evidence of malignancy.

Favoured diagnosis

In the context of a solitary lesion, the morphological features are consistent with a MYELOLIPOMA

Comment

These are benign tumours, usually solitary, non-functioning and not associated with haematological disorders.
