

## LYMPHOMATOID PAPULOSIS

**Microscopy:** Skin biopsy shows a wedge-shaped infiltration composed of polymorphous and perivascular superficial dermal infiltrate admixed with occasional scattered large atypical Reed Sternberg like cells. Variable epidermotropism is noted.

**Diagnosis:**

Lymphomatoid papulosis.

**Further work:**

1. Immunohistochemistry

	CD 3	CD 4	CD 8	CD 30
Lymphomatoid papulosis.	+	+	+	
Infection, drugs				+

2. Send material for flow cytometry.

3. MDT discussion

4. Expert opinion.

5. Send material for Molecular and cytogenetic studies.

**Comment:**

1. Presents as chronic Brent self-healing skin lesion.

2. DUSP-22-IRF4 rearrangement.

3. Indolent with good prognosis.
